

Pothos or Devil's Ivy Care Tips

Epipremnum aureum

Origin: Solomon Islands

Height: To 8 ft (2.4 m)

Light: Low light to bright light. No direct sun. Although pothos will tolerate low light, it will have more leaves and better variegation if kept in bright light.

Water: Allow soil to dry slightly between waterings. It will not tolerate soggy soil. Yellow leaves are a sign of overwatering.

Humidity: Average room humidity.

Temperature: Average to warm 60-80°F/16-27°C

Soil: Any good potting mix that drains well.

Fertilizer: Feed every 2 weeks spring through fall with a balanced liquid fertilizer diluted by half. In winter, feed monthly.

Propagation: Stem tip cuttings root easily in water or moist perlite or vermiculite. Cut a 4-6-inch stem tip with a couple leaves attached. It takes about 4 weeks to root.
